

B31 Series Regulator

Light Commercial and Industrial Regulator

Appropriate for light commercial and industrial uses where inches of water column or pounds delivery is desired such as utility services and small to medium sized furnaces and boilers. The rapid response of the B31 is particularly well suited for applications where sudden on/off loads could cause shock problems.

Descriptions

- » B31R The B31R is the internal relief valve (R) version of the B31 Series. The 1" internal relief valve provides exceptional relief capacity
- » B31N The B31N is a spring loaded self-operated regulator with no internal relief (N) valve. This model can be used on low or intermediate inlet pressures where an internal relief or other type of over-pressure protection device is not required
- » B31IMN The B31IMN is equipped with an Internal Monitoring (IM) device and no internal relief valve (N). This version is appropriate for applications where overpressure protection is desired without the relief of gas to the atmosphere
- » B31IMR The B31IMR is equipped with an Internal Monitoring (IM) device as well as a back-up Internal Relief Valve (R). This version is appropriate for applications where an added level of overpressure protection is desired
- » B31IMRV The B31IMRV is equipped with an Internal Monitoring (IM) device as well as a back-up Internal Relief Valve^{*} and a Vent (V) hole in the sliding orifice. The Vent hole option allows the relief valve to "weep" gas to the atmosphere and signal

monitor control in the event the main valve fails to control the downstream pressure

» B31RAS – The B31RAS is equipped with a Low Pressure Shut-off Valve and Internal Relief. The low-pressure shut-off valve will close if the flow through the regulator exceeds its maximum flow rate (See Capacity Table for shut-off flow values). The internal relief valve will open if the downstream pressure rises approximately 7" w.c. above the regulator's set point

Option Designations

- » N No Internal Relief
- » R Internal Relief
- » IMN Internal Monitor with no Internal Relief
- » IMR Internal Monitor with Internal Relief
- » IMRV Internal Monitor with Internal Relief and Vent
- » HP All models for outlet pressures > 0.5 psig
- » RAS Internal Relief with Low Pressure Shut-off valve

Model B31 Series regulators are certified to B109.4/CSA 6.18, and Z21.80/CSA 6.22 specifications.

Features

- » Field Interchangeable orifice
- » 27 in² of diaphragm area
- » Spring-loaded internal relief valve assembly
- » Interchangeable adjustment spring
- Controlled breather orifice size eliminates pulsation and provides normal actuation at low flows
- Wide range of NPT valve body sizes including mixed inlet and outlet sizes; angle body

Benefits

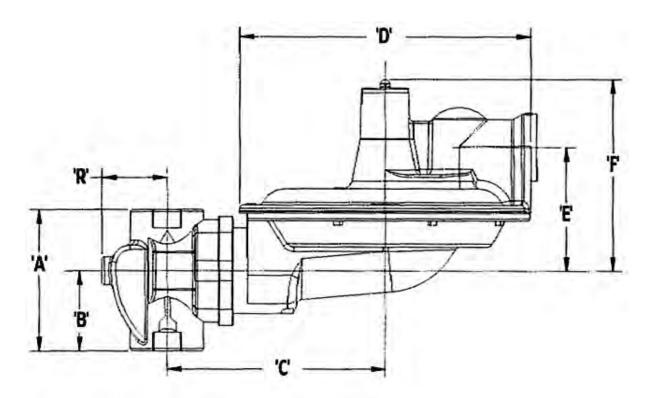

- » Smooth control at widely varying inlet pressures
- » Rugged construction
- » Fast response protects equipment from shock damage
- » Unmatched overpressure protection with Internal Monitor plus Internal Relief (IMR) option
- » No special tools required for outlet pressure adjustment
- » Designed to meet D.O.T., ANSI, CSA, and AGA-GAMA Safety Standards

B31 SERIES LIGHT COMMERCIAL AND INDUSTRIAL REGULATOR SHIPPING WEIGHT

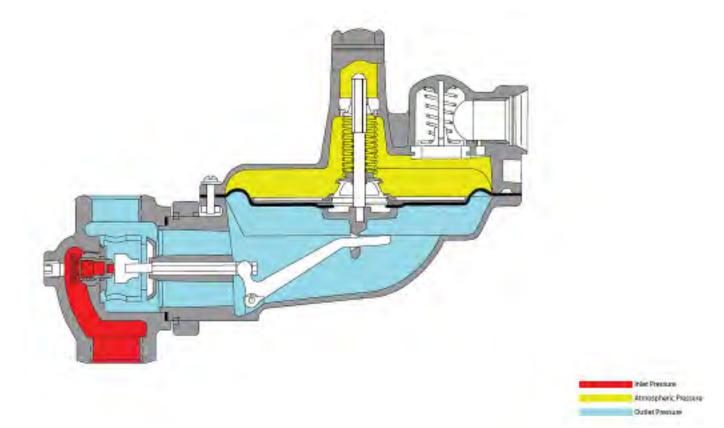

Eight regulators per box Box weight: 52 lbs.

OPERATING TEMPERATURE RANGE

» -20°F to 150°F

» Silicone valve seats available for applications below -20°F

ADDITIONAL SPECIFICATIONS

Available Vent Sizes:	1/4", 3/8", 3/4", and 1″		
Other Available Options	Seal wire to indicate unapproved tampering		
	1/8" pipe plug tap on upstream side of valve body		
	Tamper-proof (Torx head) diaphragm case screws		

CONSTRUCTION

ROOTS Regulators takes pride in delivering products with the utmost concern for safety, quality, and customer satisfaction.

Construction materials

Valve body	High tensile strength cast iron (ASTM A-126, Class A)
Orifice	Aluminum, standard brass, optional (ASTM B16, Alloy 360)
Valve seat	Buna-N or silicone (for temperature below -20°F)
Valve stem	Aluminum
Lever pin	Stainless steel (Type 303)
Lever	Zinc and dichromate plated steel (AISI C1010)
Upper diaphragm plate	Zinc and dichromate plated steel (14-gauge steel)
Lower diaphragm plate	Die cast aluminum (ASTM B85 Alloy SC84A)
Diaphragm	Buna-N and nylon reinforcing fabric
Vent valve/seat	Neoprene
Vent screen	Stainless steel (16 mesh)
Adjustment ferrule	Delrin; die cast aluminum for HP ver. (ASTM CS43A)
Seal cap	Die cast aluminum (ASTM CS34A) or ABS plastic
Diaphragm case	Die cast aluminum (ASTM B85 Alloy SC84A)
Internal monitor orifice	Brass (ASTM B16 Alloy 360)

VALVE BODY SIZES

Inlet (inches)	Outlet (inches)	90° Angle	Straight
3/4	3/4	Х	Х
3/4	1	Х	Х
3/4	1 - 1/4	-	Х
1	1	Х	Х
1	1 - 1/4	-	X
1 - 1/4	1 - 1/4	-	Х

Note X indicates that the valve body is available in that configuration.

CORRECTION FACTORS FOR NON-NATURAL GAS APPLICATIONS

The B31 may be used to control gases other than natural gas. To determine the capacity for gases other than natural gas, multiply the values within the capacity tables by a correction factor. The table below lists the correction factors for some of the more common gases:

Gas Type	Specific Gravity	Correction Factor (CF)
Air	1.00	0.77
Butane	2.01	0.55
Carbon Dioxide (Dry)	1.52	0.63
Carbon Monoxide (Dry)	0.97	0.79
Natural Gas	0.60	1.00
Nitrogen	0.97	0.79
Propane	1.53	0.63
Propane-Air-Mix	1.20	0.71

To calculate the correction factor for gases not listed in the table above, use the gases' specific gravity and insert it in the formula listed below:

Correction Factor (CF) =

$$\sqrt{\frac{SG_1}{SG_2}}$$

Where:

 $SG_1 = Specific gravity of the gas in which the capacity is published.$

 $SG_2 = Specific gravity of the gas to be controlled.$

Wide Open Flow Calculations

For wide-open orifice flow calculations use the following equations:

For:
$$\frac{p_1}{p_2} < 1.89$$
 use: $Q = K\sqrt{P_2(P_1 - P_2)}$ For: $\frac{p_1}{p_2} > 1.89$ use: $Q = \frac{KP_1}{2}$

Where:

 $P_1 =$ Absolute Inlet Pressure (PSIA) Q = Flow Rate (SCFH) P₂ = Absolute Outlet Pressure (PSIA) K = Orifice Coefficient (SCFH/PSI)

COMPLIANCE

B31 (internal relief model) compliance with ANSI Z21.80, Line Pressure Regulators

Model B31R used with a 1" vent connection is listed and compliant with ANSI Z21.80. With inlet pressures up to 2 PSIG, the B31R is compliant in any configuration.

With inlet pressures up to 5 PSIG, the B31R is compliant in the configurations listed in the following table:

Orifice Size	Set Point	Maximum Vent Line Length (ft.)*	Number of Elbows**
1/8"	Up to 1 PSIG	50	4 or less
3/16"	Up to 1 PSIG	40	4 or less
1/4"	Up to 7" w.c.	40	4 or less
5/16"	Up to 7" w.c.	15	4 or less
3/8"	Up to 7" w.c.	10	2 or less

With inlet pressures up to 10 PSIG, the B31R is compliant in the configurations listed in the following table:

Orifice Size	Set Point	Maximum Vent Line Length (ft.)*	Number of Elbows**
1/8"	Up to 14" w.c.	50	4 or less
3/16"	Up to 14" w.c.	50	4 or less
1/4"	Up to 7" w.c.	20	4 or less
5/16"	Up to 7" w.c.	No vent pipe	No elbows

*Clean 1" black steel pipe

**For each elbow greater than 4 elbows, subtract 2.6 ft. from the maximum vent line length.

B. Outlet pressure increase required for lock up.

B31HP PERFORMANCE CURVES

2 PSIG Set Point

Type and model	B31HP
Inlet size	3/4″ NPT
Outlet size	1″ NPT
Orifice Size	3/16″

All test results are reported at a base of 14.7 PSIA at 60°F and with 0.6 S.G. gas.

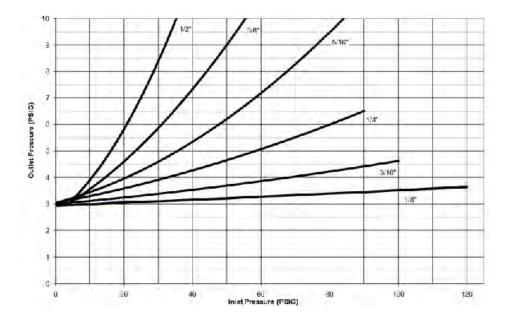

RELIEF CURVES

2 PSIG Set Point

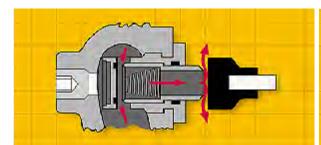

Type and model	B31HP
Inlet size	3/4″ NPT
Outlet size	1″ NPT
Orifice Size	1″ NPT

All test results are reported at a base of 14.7 PSIA at 60° F and with 0.6 S.G. gas.

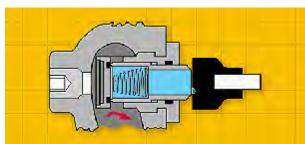

Regulator set at 2 PSIG for relief testing with 40 PSI inlet pressure @ 50 SCFH as per ANSI B109.4.

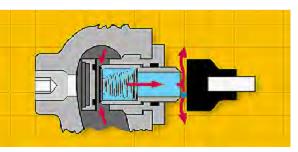

B31 SERIES LIGHT COMMERCIAL AND INDUSTRIAL REGULATOR, MODELS N AND R

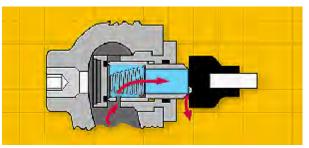

A. Standard regulator and upstream monitor orifice.

C. Main orifice failed - upstream monitor orifice lock-up.

B. Standard regulator orifice failed; upstream monitor orifice control.

D. V option - vents a small volume of gas to atmosphere through relief valve.

Outlet pressure

PRINCIPLE OF OPERATION

A. Normal operation. The internal monitor IM orifice performs like a standard regulator and monitor regulator in that main orifice and valve seat actuate to control outlet flow and pressure under normal flow conditions. If there is no demand, the main seat and internal monitor orifice will close.

B. Monitor operation. If the main valve seat fails to control the gas flow and pressure due to foreign matter between the seat and orifice face, or if the seat is eroded, the internal monitor orifice automatically goes into operating position at a slightly at a slightly higher outlet pressure (see Internal Monitor Lock-up Pressure table). Any time the pressure on the main diaphragm exceeds the force of the fixed monitor spring, the increased outlet pressure causes the main valve seat to push against the sliding orifice. The sliding orifice compresses the monitor spring and positions the monitor orifice to control the gas flow. The IM orifice now functions as a monitor regulator and continues to monitor as long as the main seat fails to control at the normal adjusted outlet pressure. If the gas load demand is increased beyond the internal monitor's capacity, the outlet pressure is reduced to normal adjusted pressure and the regulator resumes normal regulation.

C. Monitor lock-up. If the demand for gas is decreased to zero flow during monitor operation, the sliding orifice continues to close until its orifice is in the gas tight position (monitor lock-up) against the BUNA-N monitor valve seat. (See the Internal Monitor Lock-up Pressure table for the outlet pressure required for internal monitor lock-up.)

D. Vent hole V option. On installations where a small volume of over-pressure gas can be safely vented to the atmosphere, the advantages of both the pilot relief valve and monitor safety can be combined. If the flow is decreased to zero or just greater than zero, the vent hole in the internal monitor orifice allows gas to slowly bleed downstream and cause the pressure to rise to the relief point of the pilot's internal relief valve. The gas then bleeds to the atmosphere indicating a problem with the regulator.

INTERNAL MONITOR LOCK-UP PRESSURE

VENT LINES FOR REGULATORS

When constructing vent lines to be attached to regulators installed indoors, follow a few basic rules:

- a. Never use pipe sizes smaller than the vent size; smaller pipe sizes restrict the gas flow. If a long gas run must be used, ROOTS Regulators advises increasing the pipe one nominal size every ten feet to keep the flow restriction as low as possible.
- b. Keep the vent line length as short as possible to minimize the restriction and reduce the vent's tendency to cause regulator pulsation.
- c. Support the vent pipe to eliminate strain on the regulator diaphragm case.
- d. Always point outdoor vent pipes in the downward position to reduce the possibility of rain, snow, sleet, and other moisture entering the pipe. Install a bug screen in the end of the pipe.
- e. Do not locate the vent line terminus near windows, fans, or other ventilation equipment. See the installation instructions furnished with the regulator.
- f. Adhere to all applicable codes and regulations.
- g. If your vent pipe causes regulator pulsation, consult your sales representative or manufacturer.
- h. ROOTS Regulators strongly recommends running a separate vent line for each regulator. Headers with various installed devices can cause regulator malfunction.

Caution Ensure the end of the vent line is away from ANY potential ignition sources. It is the installer's responsibility to ensure the vent line is exhausting to a safe environment.

INSTALLATION

Warning ROOTS Regulators does not endorse or warrant the completeness or accuracy of any third party regulator installation procedures or practices, unless otherwise provided in writing by ROOTS Regulators. Follow your company's standard operating procedures regarding the use of personal protection equipment (PPE). Adhere to guidelines issued by your company in addition to those given in this document when installing regulators.

- a. Remove all shipping plugs from the regulator inlet, outlet, and vent before installation.
- b. Verify the piping interior and regulator inlet and outlet are clean and free of dirt, pipe dope, and other debris. Dirt and other foreign materials entering the regulator can cause a loss of pressure control.
- c. Apply pipe joint sealant to the male pipe threads. Do not use pipe joint material on the regulator's female threads. Joint sealant could become lodged in the regulator and cause a loss of pressure control.
- d. Gas must flow through the regulator's valve body in the direction cast on the regulator body. Gas flowing in the wrong direction can overpressure and cause damage to the regulator.
- e. The pilot diaphragm casing can be mounted in any position relative to the body through a full 360° angle at 90° increments.
- f. When the regulator is installed OUTDOORS, the vent must always be positioned so that rain, snow, moisture or foreign particles cannot enter the vent opening. ROOTS Regulators recommends positioning the pilot vent downward to avoid entry of water or other matter which could interfere with the proper operation of the regulator. The vent should be located away from building eaves, window openings, building air intakes and above the expected snow level at the site. The vent opening should be inspected periodically to insure it does not become blocked by foreign material as outlined in DOT PHMSA-RSPA-2004-19856.
- g. When the regulator is installed INDOORS, the vent must be piped to the outside atmosphere using the shortest length of pipe, the fewest possible pipe elbows, and a pipe diameter as large as the vent size or larger. USING VENT PIPE SMALLER THAN THE VENT CONNECTION LIMITS THE REGULATOR'S INTERNAL RELIEF VALVE CAPACITY. The outlet end of the pipe must be protected from moisture and the entrance of foreign particles. The regulator should be specified by the user with the size vent and pipe threads desired to make the vent pipe connection.

START-UP PROCEDURE

1. Mount a pressure gauge downstream of the regulator to monitor the downstream pressure.

- 2. With the downstream pressure valve closed, slowly open the inlet valve. The outlet pressure should rise to slightly more than the setpoint. Verify there are no leaks and all connections are tight.
- 3. The regulator was pre-set at the factory to match order specifications. If necessary, adjust the outlet pressure by removing the seal cap on the top of the pilot spring housing and adjusting the ferrule or screw inside the pilot spring housing using a large flat-head screwdriver. With a small amount of gas flowing through the regulator, rotate the pilot ferrule clockwise to raise the outlet pressure or counter-clockwise to lower the outlet pressure.
- 4. Replace the seal cap and check for leaks after the desired outlet pressure is achieved.

The regulator is ready for operation.

SAFETY WARNING

This product, as of the date of manufacture, is designed and tested to conform to all governmental and industry safety standards as they may apply to the manufacturer. The purchaser/user of this product must comply with all fire control, building codes, and other safety regulations governing the application, installation, operation, and general use of this regulator to avoid leaking gas hazards resulting from improper installation, startup or use of this product.

ROOTS Regulators strongly recommends installation by a qualified professional and periodic inspection of pressure regulators (inspections may be required by local applicable codes or regulations).

Inspections should include checking for gas quality, cycle numbers, external environmental changes, and operating conditions that impact wear on the regulator's moving parts. To ensure safe and efficient operation of this product, replace worn or damaged parts found during inspection.

Limited Warranty

ROOTS Regulators are subject to the terms and conditions of the Natural Gas Solutions North America, LLC General Terms & Conditions For Sale of Products, Parts and Services, and no other terms shall apply, unless agreed upon by the parties in writing. The Natural Gas Solutions North America, LLC General Terms & Conditions For Sale of Products, Parts and Services can be found on the Dresser Utility website: dresserutility.com/ forms-questionnaires-and-terms-conditionssale.

Ordering Information

Specify:

- 1. Inlet and outlet connection size and type
- 2. Model number
- 3. Outlet pressure desired
- 4. Pilot needed
- 5. Inlet pressure range
- 6. Type of gas and maximum capacity required
- 7. Assembly position number (see chart on page 31)
- 8. Special requirements such as tagging, ¹/₈" pipe plug tap, seal wire, etc.
